summaries

Database: swiss-prot38 1:swissprot

Statistics: Mean 48.589; Variance 103.194; scale 0.471

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

.Psrch\_pp protein - protein database search, using Smith-Waterman algorithm Tue Sep 26 16:18:57 2000; MasPar time 8.99 Seconds 613.770 Million cell updates/sec

Tabular output not generated.

Title:

Description: Perfect Score: Sequence: >US-09-308-435-4
(28-260) from US09308435.pep
1599
1 CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

Scoring table: PAM 150 Gap 11

Searched: 188963 seqs, 23686106 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq36 1:geneseqp

Statistics: Mean 32.470; Variance 175.985; scale 0.185

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This polypeptide comprises a 29 kDa surface antigen which is comprises on the dividing (bacillary) and resting (colloid) forms of Helicobacter pylori. The antigen gives rise to both systemic and local (mucosal) production of antibodies. It is an adhesin that is conserved in all tested strains of H. pylori, and is also a putative virulence factor. The invention relates to a new pharmaceutical composition comprising a lipid aggregate of a new pharmaceutical composition comprising a lipid aggregate of a negatively charged lipid or lipid mixture and at least one cantigenic, native or recombinant antigen of H. pylori, preferably the surface-exposed 29 kDa antigen, or a nucleic acid (see V34643) coding for such an antigen. The new formulations, which are useful as vaccine formulations, elicit a protective immune response against H. pylori infections, and are suitable for therapeutic and prophylactic use. An adequate response is produced even without adjuvant. A second, claimed 29 kDa antigen (see W60156) is provided that differs only at residue 222 (Ser for Arg).
                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Helicobacter pylori surface exposed antigen - useful for treatment, prophylaxis or diagnosis of mammalian infections sclaim 2; Page 34-35; 49pp; English.

Claim 2; Page 34-35; 49pp; English.

Claim 2; Page 34-35; 49pp; English.

Claim 2; Page 34-35; 49pp; English and dividing forms of the surface of resting and dividing forms of the bacterium. It is conserved in all tested strains of H. pylori, and gives rise to both systemic and local (mucosal) prodn. of antibodies. Its amino acid sequence was deduced from a cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43834); a sequence (W07550) deduced from a second cDNA clone (T43835) differs only at position 222 (Arg for Ser). Recombinant cantigen can be produced in transfer dost cells. It is useful for the diagnosis and treatment of H. pylori infections and for use as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

H. pylori adhesin gene, and the V. cholerae toxin A2 and B subunit genes. CC This protein is used in the diagnosis of and as a vaccine against CC H. pylori, which is the main cause of gastritis and gastric/duodenal CC ulcers. It may also be used in the production of an anti-H. pylori CC antibody. Vectors containing the DNA sequence and E. coli strains CC containing it form the basis of a process to produce the protein, which CC consists of culturing the microorganism and obtaining the protein. The CC protein is an effective vaccine against H. pylori due to its excellent CC and its ability to penetrate through the stomach environment, CC stimulate sigh production.

CC Note: This sequence was indexed from W09853082, which is the first CC major country equivalent to KR97059278.

         Recombinant or substantially pure preparations of H. pylori polypepti are disclosed, together with the nucleic acids encoding them. In all, 73 ORFS are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at less nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.

This sequence represents a H. pylori protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified condicted from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents an H. pylori derived protein, no further details are given in the specification.

Chearils are given in the specification sequences of the invention of the invention.

Chearils are given in the specification sequences of the invention of the sequence.

Chearils are given in the specification in the pylori nucleic acid sequences, and corresponding proteins, are considered.

Chearils are given in the specification of sequences, and corresponding proteins, are considered.

Chearils are given in the sequences, and corresponding proteins of the sequence.

Chearils are given in the sequences, and corresponding proteins are considered in this protein and interests in the sequences of these sequences are complementary to the stail of the specification of a gene from Helicobacter specification.

Chearils are given in the specification of the sequences of these sequences are complementary to the stail-cut pylori whole genomic DNA was isolated and nebulised to a median size of complementary to the stail-cut pylori while the overhang is not self-complementary. Therefore the linkers will not concatemerise nor will the cut vector re-ligate itself easily. The linker-adapter inserts of sentences of the sequences of the series of sentences.

Chearily are the series of the series of the series of the sequences are then sequences are the sequences are the sequences are the sequences a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from coverlapping contigs generated by mechanically shearing the bacterial CDNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To cidentify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

Helicobacter pylori nucleic acid sequences and encoded polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection claim 14; Pages 558-559; 1145pp; English.

This sequence is a H. pylori protein of unspecified function. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. DNA and probes derived from it may be used for the identification of the pylori in a sample and the diagnosis of H. pylori infection. Nuc

Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA, Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amin'ification for recombinant orlumential annotherian. or in E. Coli
                                                                                                                                                                            Al-Garawi A, Kleanthous H, Miller C, Oomen RP, Tomb J; WPI; 98-542293/46.

New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases claim 8; Page 455-456; 2054pp; English.

This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for sequence 240 also per se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 H. pylori GHPO 1615 proteir GHPO protein; Helicobacter peptic ulcer disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Y10951
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (ASTR ) ASTRA AB.

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Tabular output not generated. Tue Sep 26 16:20:02 2000; MasPar time 9.81 Seconds 735.665 Million cell updates/sec

Title:

Description: Perfect Score:

Sequence: >US-09-308-435-4 (28-260) from US09308435.pep 1599 1 CSPHIIETNEVALKLNYHPA.....QKNLESYQKDAKELKGKRNR 233

Scoring table: PAM 150 Gap 11

Searched: 85661 segs, 30989116 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot38 1:swissprot

Statistics: Mean 48.644; Variance 103.561; scale 0.470

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Sequence analysis of the CEN12 region of Saccharomyces cerevisiae on a 43.7 kb fragment of chromosome XII including an open reading frame homologous to the human cystic fibrosis transmembrane conductance regulator protein CFTR.";

I yeast 12:693-708(1996).

I regulator protein CFTR.";

C -!- FUNCTION: COMPONENT OF THE ORIGIN RECOGNITION COMPLEX (ORC) THAT BINDS ORIGINS OF REPLICATION. IT HAS A ROLE IN BOTH CHROMOSOMAL REPLICATION AND MATING TYPE TRANSCRIPTIONAL SILENCING. BINDS TO THE ARS CONSENSUS SEQUENCE (ACS) OF ORIGINS OF REPLICATION.

C -!- SUBUNIT: ORC IS COMPOSED OF SIX SUBUNITS OF 120 KDA, 71 KDA, 62 KDA, 56 KDA, 53 KDA AND 50 KDA.

C -!- SUBCELLULAR LOCATION: NUCLEAR.

NIAIII and a cytosine-type methylase.";

MOL. Gen. Genet. 224:101-110(1990).

-I- FUNCTION: THIS METHYLASE RECOGNIZES THE DOUBLE-STRANDED SEQUENCE, CAUSES SPECIFIC METHYLATION ON C-2 ON BOTH STRANDS.

-I- CATALYTIC ACTIVITY: S-ADENOSYL-L-METHIONINE + DNA CYTOSINE S-ADENOSYL-L-HOMOCYSTEINE + DNA 5-METHYLCYTOSINE.

-I- SIMILARITY: STRONG, TO OTHER C5-DNA METHYLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright.
